

The Problem

Our elders face three critical challenges that affect their quality of life daily.

1. They live with the constant fear of falls when alone at home.
2. They experience isolation as physical distance separates them from loved ones.
3. They worry about medical emergencies knowing help might not arrive quickly

Beyond physical safety, there's a silent emotional toll. The loss of independence affects dignity and self-worth. Families feel guilty and anxious when their loved ones are alone. Everyone deserves the freedom to age gracefully in their own homes, connected and secure.

Our Solution: Sahay

Sahay transforms how elders interact with technology. Instead of complex menus and tiny icons, we provide a simple, intelligently designed Android launcher that puts safety and connection at its heart. The name "Sahay" means "help" or "assistance" in Hindi—reflecting our mission to empower elders with dignified support.

Key Features

Genie Voice Assistant

Voice-controlled interface allows elders to make calls, send messages, and trigger emergency alerts using natural conversation

Simple Dashboard

Large-button interface with high-contrast colors makes navigation effortless without zooming or precise finger placement

Passive Safety Monitoring

Intelligent inactivity detection tracks movement patterns and alerts family when unusual stillness suggests a potential emergency

SOS with Live Location

One-touch emergency button shares real-time GPS coordinates with trusted contacts and medical responders

What makes Sahay unique is its human-centered approach. Before escalating any emergency, it provides voice confirmation to prevent false alarms. The emotional check-in system encourages daily usage through positive engagement. This isn't just another safety app—it's technology designed with empathy, respect, and the specific needs of aging users in mind.

Main Dashboard

High-contrast interface with simple navigation designed for effortless use

SOS Activation

Intelligent detection with voice confirmation before emergency escalation

Genie Assistant+Prescription Vault

Natural voice commands for calls, messages, and emergency situations

Technology Stack

Sahay is built using modern Android development practices with a focus on reliability, maintainability, and scalability.

Frontend Architecture

Written in Kotlin using Android Studio with MVVM (Model-View-ViewModel) architecture pattern. This ensures clean separation between UI and business logic, making the codebase easy to test and maintain.

Data Management

Room Database for local persistence and DataStore for user preferences. These modern Android components provide reliable data handling with minimal boilerplate code.

AI & Voice Processing

Speech Recognition API for voice commands and Text-to-Speech for responsive feedback. Uses device-native capabilities for privacy-first voice interaction without requiring cloud processing.

Safety Features

GPS Location Services for real-time tracking, SMS and Phone Call APIs for emergency alerts, and background monitoring for inactivity detection. All permissions are explained clearly during onboarding.

Impact & Future Vision

Immediate Impact

- **Restored independence** – Elders regain confidence using technology without assistance
- **Reduced family anxiety** – Real-time monitoring provides peace of mind for caregivers
- **Emotional connection** – Daily engagement features strengthen family bonds across distances
- **Safer aging** – Faster emergency response potentially reduces hospitalization costs

Scalability & Future Features

→ Geographic Expansion

Deploy across assisted living facilities and multi-city residential complexes

→ Advanced Safety

Smart fall detection using motion sensors and emergency health report automation

→ Healthcare Integration

Connect with hospital systems for direct emergency routing and medical history access

→ Healthcare Services

Medicine auto-ordering, pharmacy integration, and government benefit enrollment
